

PHAROS

PAYMENT INCIDENT INTELLIGENCE

Detect the drop. Investigate the cause.

The Control Tower for payment incidents.

THE PROBLEM

Approval is only the symptom.

Payment teams see a simple symptom. But the cause is rarely simple.

NORMAL NOISE?

PROVIDER?

ISSUING BANK?

MARKET?

One bad minute is not an incident.

Volume changes how certain we should be.

01	BASELINE	Beta-Binomial credible range by segment
02	RESIDUAL	drop below range · negative EWMA
03	PERSISTENCE	enough volume · three consecutive windows

Sustained and statistically meaningful.

A cause is proven by its controls.

Comparable segments · healthy controls · competing explanations

Root Cause Analysis
isolate the cause.

PHAROS turns the signal into a safe recommendation.

The model only sees evidence it can cite.

No hidden truth. No unsupported claims.

01 **DETECTOR** baseline · anomaly · RCA · impact

02 **INVESTIGATOR** read-only tools · cited evidence IDs

03 **AUDITOR** checks scope · blocks overclaiming

History is context. Current evidence decides.

Evidence falls short. PHAROS abstains.

SAFE FAILURE

**Inconclusive is better than being
confidently wrong.**

Recommendation matches the supported problem

OUR PRINCIPLE

From a payment signal to a defensible decision.

Detect statistically. Explain with evidence. Recommend to users.

Never act automatically.
